CSE - Academic Year 2026-27
Java Programming Lab | Batch 2025-29

ASSIGNMENT : 29

Name of Student	Anushree Shinde
PRN No.	25070122041
Batch	CSE A - 2
Class	Java Programming Lab
Academic Year & Semester	2025-29 : Semester 3
Date of Submission	

TITLE : Write a JSP application to demonstrate the basic concepts of Java Server Pages.

Learning Objectives : To develop dynamic web pages using Java Server Pages.

Theory : Java Server Pages (JSP) is a server-side technology used for developing dynamic web applications. JSP allows Java code to be embedded within HTML pages using special JSP tags. When a JSP page is requested, the web server automatically translates it into a servlet, compiles it, and executes it to generate dynamic web content. JSP supports implicit objects, directives, scripting elements, expression language, and standard tag libraries. It simplifies web development by separating presentation from business logic. JSP is commonly used with Servlets and JDBC for building database-driven web applications.

Exercise :

1. Create a JSP page to display student information entered by the user

```
<!DOCTYPE html>
<html>
<head>
    <title>Student Information</title>
</head>
<body>
    <h2>Student Information Form</h2>

    <form method="post">
        Name: <input type="text" name="name" required><br><br>
        PRN: <input type="text" name="prn" required><br><br>
        Class: <input type="text" name="studentClass" required><br><br>
        Email: <input type="email" name="email" required><br><br>

        <input type="submit" value="Submit">
    </form>

    <%
        String name = request.getParameter("name");
        String prn = request.getParameter("prn");
        String studentClass = request.getParameter("studentClass");
        String email = request.getParameter("email");

        if (name != null && prn != null &&
            studentClass != null && email != null) {
    %>

    <h2>Student Details</h2>
    <p>Name: <%= name %></p>
    <p>PRN: <%= prn %></p>
    <p>Class: <%= studentClass %></p>
    <p>Email: <%= email %></p>

    <%
        }
    %>
</body>
</html>
```

OUTPUT :

2. Create a JSP application that takes user registration details such as Name, Email, Phone Number, and Password, and displays the submitted information on a result JSP page.

```
Register Program
<!DOCTYPE html>
<html>
<head>
    <title>User Registration</title>
</head>
<body>
    <h2>User Registration Form</h2>

    <form action="result.jsp" method="post">
        Name: <input type="text" name="name" required><br><br>

        Email: <input type="email" name="email" required><br><br>

        Phone Number: <input type="tel" name="phone" required><br><br>

        Password: <input type="password" name="password"
required><br><br>

        <input type="submit" value="Register">
    </form>
</body>
</html>
```

Result Program

```
<%@ page contentType="text/html" pageEncoding="UTF-8" %>
<!DOCTYPE html>
<html>
<head>
    <title>Registration Result</title>
</head>
<body>
    <h2>Registration Successful</h2>

    <%
        request.setCharacterEncoding("UTF-8");

        String name = request.getParameter("name");
        String email = request.getParameter("email");
        String phone = request.getParameter("phone");
        String password = request.getParameter("password");

        if (name != null && email != null &&
            phone != null && password != null) {
    %>
    <p>Name: <%= name %></p>
    <p>Email: <%= email %></p>
    <p>Phone Number: <%= phone %></p>
    <p>Password: ********</p>

    <%
        } else {
    %>

    <p>Please submit the registration form correctly.</p>

    <%
        }
    %>

    <br>
    <a href="register.jsp">Back to Registration</a>
</body>
</html>
```

OUTPUT :

Outcome :

- Understood the basic concepts of Java Server Pages (JSP).
- Learned to create dynamic web pages using HTML forms and JSP.
- Understood how to retrieve submitted form data using request.getParameter().
- Learned how JSP processes user input and displays the submitted information.
- Successfully implemented JSP applications for displaying student information and processing user registration details.

Conclusion :

This assignment demonstrated the use of JSP for developing dynamic web applications. Student information and registration details were collected through HTML forms and displayed on result pages using JSP. The assignment helped in understanding form submission, request parameter handling, and the generation of dynamic web content.
